*Antimicrobial Peptides***FIELD OF THE INVENTION**

5           The present invention relates to novel antimicrobial peptides which can be obtained from the milk protein casein or chemically synthesised or produced by recombinant DNA technology. These peptides can be used in foods as antimicrobial preservatives, in oral care products (eg. toothpaste, mouthwash, dental floss) for the control of dental plaque and suppression of  
10 pathogens associated with dental caries and periodontal diseases. The antimicrobial peptides may also be used in pharmaceutical preparations for topical or parenteral application or oral administration for the control of oro-pharyngeal and gastro-intestinal pathogens as well as systemic or localised infections.

**BACKGROUND OF THE INVENTION**

Periodontal diseases are bacterial-associated inflammatory diseases of the supporting tissues of the teeth and are a major public health problem.  
20 Nearly all of the human population is affected by periodontal diseases to some degree. In a recent Melbourne survey (Spencer *et al.*, 1985) only 20% of the adult dentate sample did not require periodontal treatment while 62% required intermediate treatment and 18% required complex treatment. Brown *et al.* (1989), from an extensive US Dental Health survey reported that  
25 only 15% of the studied population was free of periodontal diseases. The major form of periodontal disease is gingivitis which is associated with the non-specific accumulation of dental plaque at the gingival margin. In contrast, the less prevalent, destructive form of periodontal disease (periodontitis) is associated with a subgingival infection of specific  
30 Gram-negative bacteria. Periodontitis is a major cause of tooth loss in Australian adults.

Although gingivitis may not be a necessary precondition for the development of periodontitis (Christersson *et al.*, 1989) gingivitis is likely to predispose susceptible sites to more serious forms of periodontal disease  
35 since the specific Gram-negative bacteria that predominate in periodontitis, but which are not detectable in the healthy periodontium, have been found

in low proportions in gingivitis (Moore *et al.*, 1987). Further, the environmental conditions that develop during gingivitis are likely to favour the subsequent colonisation or growth of the species implicated in periodontitis. The control of supragingival plaque is therefore considered an important part of a preventive strategy for the control of periodontal diseases and in fact various plaque control programs have proven to be successful in the prevention of periodontal diseases (Loesche, 1976). In the majority of individuals the customary oral hygiene method of toothbrushing is usually insufficient by itself over long periods to provide a level of plaque control compatible with oral health. Consequently the incorporation of antimicrobial agents into dental products as an aid to controlling dental plaque and gingivitis has been advocated (Addy, 1988; Marsh, 1991) and is of considerable interest to toothpaste and mouthwash companies. A number of agents have been suggested as antiplaque toothpaste additives (eg. bisbiguanides, phenols, metal ions, quaternary ammonium salts) but have either negligible intra-oral activity, undesirable side-effects (eg. mucosal irritation, tooth discolouration) and/or an incompatibility with toothpaste formulations. Triclosan (2,4,4'-trichloro-2'-hydroxy diphenyl ether) an antimicrobial agent used extensively in deodorants, soaps and other dermatological preparations is currently being used as an anti-plaque toothpaste additive in some countries however there is considerable interest to find a clinically efficacious, safe and natural antiplaque agent.

Antimicrobial peptides are widely distributed in nature and play a role in the host defence of plants and animals (Boman and Hultmark, 1987; Bevins and Zasloff, 1990). They include amongst others, the amphipathic channel forming peptides, for example the cecropins isolated from the cecropia moth (Boman and Hultmark, 1987), the magainins isolated from skin secretions of the African clawed frog *Xenopus laevis* (Bevins and Zasloff, 1990), the dermaseptins isolated from the skin of the arboreal frog (Mor and Nicolas, 1994) and the bombinins from the skin of *Bombina variegata* (Simmaco *et al.*, 1991). Other antimicrobial peptides include the cyclic cationic peptides containing an intramolecular disulphide, for example ranalexin from bullfrog skin (Clark *et al.*, 1994) and bactenecin from bovine neutrophils (Romeo *et al.*, 1988). Proline-containing antimicrobial peptides also have been identified and these include the apidaecins from the lymph

fluid of the honeybee (Casteels *et al.*, 1989) and the pig myeloid antimicrobial peptide PMAP-23 (Zanetti *et al.*, 1994).

It is now well established that the milk protein casein should be considered not only as a nutrient but also as a protecting agent against  
5 bacterial infection of the neonate mucosa as specific peptides released by tryptic or *in situ* digestion have been shown to possess marked biological activity. These bioactive peptides are relatively resistant to further proteolytic breakdown and have been detected in the distal portion of the small intestine and blood of humans after ingestion of cow's milk (Svedberg  
10 *et al.*, 1985). Migliore-Samour *et al.* (1989) have shown that peptides  $\beta$ -casein(63-68) PGPIP<sub>N</sub> and  $\alpha_{s1}$ -casein(194-199) TTMLPW at concentrations as low as 0.1  $\mu$ M exert a significant protective effect in mice against *Klebsiella pneumoniae* infection when injected intravenously at 0.3 mg/kg, before lethal infectious challenge. An antibacterial peptide from bovine  
15  $\alpha_{s2}$ -casein [ $\alpha_{s2}$ -casein (f172-203)] released by treatment of milk with glacial acetic acid has recently been characterised and shown to inhibit the growth of *Escherichia coli* and *Staphylococcus carnosus* (Zucht *et al.*, 1995).

Antimicrobial peptides having activity against a range of Gram-positive and Gram-negative bacteria have potential in the area of oral  
20 care, functional foods, food preservatives and pharmaceuticals. Oral care products include toothpaste, mouthwash, dental floss and professionally applied materials. Functional foods include chewing gum, confectionery, breakfast cereals, infant formula, beverages, lozenges etc. Food preservatives application could include dairy products, soups, salad dressings, processed  
25 meats, baked goods, sauces etc. Pharmaceutical use would include systemic and topically applied antibiotics and anti-infectives and medications for the treatment of ulcers and other gastro-intestinal tract diseases.

For food applications, natural antimicrobials are typically used for the maintenance and extension of shelf-life in sauces, wet salads, baked goods  
30 and pastries, processed meats, refrigerated dairy products, salad dressings and soaps. Nisin has limited application as a food preservative due to a relatively narrow spectrum of antimicrobial activity and high cost. Food manufacturers using casein antimicrobial peptides as a preservative may use "all natural" label claims which are not allowed when using artificial or  
35 chemical preservatives. A major trend in the food industry is the increasing demand for low fat products which in general tend to have increased

moisture levels. This creates a demand for better food preservation systems such as the incorporation of natural antimicrobials.

The global market for medications for wound healing, treatment of upper gut ulcers and inflammatory based disease represents a major pharmaceutical market. Clinicians working in the area of duodenal and gastric ulcers currently focus on the bacterium *Helicobacter pylori* as the causative agent in upper gut ulcers. Channel forming antimicrobial peptides that allow  $H^+$  to enter the bacterial cell have the potential for treatment of *H. pylori* infections by enhancing the sensitivity of the bacterium to the acid secretions of the stomach.

## SUMMARY OF THE INVENTION

The present inventors have developed new peptides which have antimicrobial activity. These peptides can be produced synthetically, however, they can most conveniently be derived from casein.

Accordingly, in a first aspect the present invention consists in an antimicrobial peptide, the peptide being non-glycosylated, less than about 100 amino acids, preferably less than about 70 amino acids, and including an amino acid sequence selected from the group consisting of:-

AVESTVATLEA $\Sigma$ PEVIESPPE,  
AVESTVATLED $\Sigma$ PEVIESPPE,  
AVESTVATLEASPEVIESPPE,  
AVESTVATLEDSPEVIESPPE,  
DMPIQAFLLYQQPVLGPVR,

and conservative substitutions therein.

In a preferred embodiment of the present invention the peptide includes an amino acid sequence selected from the group consisting of:-

AVESTVATLEA $\Sigma$ PEVIESPPE, AVESTVATLED $\Sigma$ PEVIESPPE,  
AVESTVATLEASPEVIESPPE, AVESTVATLEDSPEVIESPPE, and  
DMPIQAFLLYQQPVLGPVR, preferably AVESTVATLEA $\Sigma$ PEVIESPPE,  
AVESTVATLED $\Sigma$ PEVIESPPE, or DMPIQAFLLYQQPVLGPVR.

In a further preferred embodiment of the present invention the peptide includes an amino acid sequence selected from the group consisting of:-

- MAIPPKKNQDKTEIPTINTIASGEPTSTPTIEAVESTVATLEA $\Sigma$ PEVIESPPEINT  
 5 VQVTSTAV;  
 MAIPPKKNQDKTEIPTINTIA $\Sigma$ GEPTSTPTIEAVESTVATLEA $\Sigma$ PEVIESPPEINT

- As will be understood by those skilled in this field the peptide of the  
present invention can be conjugated to other molecules, such as acyl  
derivatives, to alter the delivery profile or pharmacokinetics of the peptide.  
35 Such conjugates are described in PCT/AU90/00599, the disclosure of which is  
incorporated herein by reference.

In a second aspect the present invention consists in a chimeric compound, the compound including the peptide of the first aspect of the present invention conjugated to a non-peptide molecule. It is preferred that the non-peptide molecule includes acyl groups.

5 In a third aspect the invention provides an antimicrobial compositions including the peptide of the first aspect of the present invention together with a pharmaceutically-acceptable carrier. Such compositions may be dental, intra-oral compositions, therapeutic anti-infective compositions for topical and systemic application. Dental  
10 compositions or therapeutic compositions may be in the form of a gel, liquid, solid, powder, cream or lozenge. Therapeutic compositions may also be in the form of tablets or capsules.

In a fourth aspect, there is provided a method of treating or preventing dental caries or periodontal disease in a subject, the method  
15 comprising the step of administering a peptide or composition of the present invention to the teeth or gums of a subject in need of such treatments. Topical administration of the peptide is preferred.

Without wishing to be bound by scientific theory it is believed that the peptides of the present invention exert their antimicrobial activity by  
20 virtue of their amphipathic nature. It is believed that the peptides are incorporated into the bacterial membrane where they form aggregates. These aggregates provide or form pores or channels through the membrane through which ions may pass. The uncontrolled passage of ions across the bacterial membrane results in the death of the bacterial cell.

25 As it is the physical nature of the peptides rather than the specific sequence of the peptide which results in their antimicrobial activity so called conservative substitutions may be made in the peptide sequence with no substantial loss of activity. It is intended that such conservative substitutions which do not result in a substantial loss of activity are  
30 encompassed in the present invention.

Whilst the concept of conservative substitution is well understood by the person skilled in the art, for the sake of clarity conservative substitutions are those set out below.

- 5           G, A, V, I, L, M;  
          D, E, S;  
          N, Q;  
          S, T;  
          K, R, H;  
          F, Y, W, H; and  
10          P, N $\alpha$ -alkalamino acids.

Where  $\Sigma$  is a phosphoseryl residue.

- The peptides of the present invention have a number of applications, for example, they can be used in foods as antimicrobial preservatives, in oral care products (toothpastes and mouthrinses) for the control of dental plaque  
15          and suppression of pathogens associated with dental caries and periodontal diseases. The antimicrobial peptides of the present invention may also be used in pharmaceutical preparations (eg, topical and systemic anti-infective medicines).

- Throughout this specification the word "comprise", or variations such  
20          as "comprises" or "comprising", will be understood to imply the inclusion of a stated element or integer or group of elements or integers but not the exclusion of any other element or integer or group of elements or integers.

## DETAILED DESCRIPTION OF THE INVENTION

25

          The present invention relates to the novel antimicrobial peptides. These peptides were initially derived from casein,  $\kappa$ -casein (106-169) and  $\beta$ -casein (184-202) [Table 1]. These peptides have potential to be used for the following micro-organisms *inter alia*.

- 30          *Streptococcus mutans*  
          *Staphylococcus aureus*  
          *Streptococcus sanguinis*  
          *Escherichia coli*  
          *Salmonella typhimurium*  
35          *Pseudomonas aeruginosa*  
          *Porphyromonas gingivalis*

*Campylobacter jejuni*  
*Listeria monocytogenes*  
*Helicobacter pylori*  
*Clostridium botulinum*  
5 *Streptococcus pyogenes*  
*Streptococcus pneumoniae*  
*Candida albicans*

10 The antimicrobial peptides Ser(P)<sup>149</sup> κ-casein B (106-169) and Ser(P)<sup>149</sup> κ-casein B (117-169) both had a minimum inhibitory concentration (MIC) of 2.4 μM against the oral pathogens *Streptococcus mutans* and *Streptococcus sobrinus* and at a ten-fold lower concentration (0.24μM) inhibited growth of these bacteria by 41%.

15 The antimicrobial peptides Ser(P)<sup>149</sup> κ-casein (117-169) and Ser(P)<sup>127</sup>, Ser(P)<sup>149</sup> κ-casein (117-169) and β-casein (184-202) can be purified from a tryptic digest of bovine casein using standard chromatographic procedures of anion exchange and reversed-phase chromatography (HPLC). Ser(P)<sup>149</sup> κ-casein (106-169) and Ser(P)<sup>127</sup>, Ser(P)<sup>149</sup> κ-casein (106-169) can also be  
20 prepared from cheese whey and rennet whey by removal of the whey proteins by ultrafiltration, or acid precipitation followed by reversed-phase HPLC purification of the phosphopeptides. The peptides can be prepared from casein of other species, eg. goat, sheep etc.

a. Sequence identified using the one letter amino acid code where Σ = Ser(P)

The peptide  $\kappa$ -casein (106-169) is present in cheese whey or rennet whey in several different forms. The peptide has two major genetic variants (A and B) and is post-translationally modified by glycosylation and phosphorylation. The glycosylated forms, known as the

5 Kappa-caseino-glycopeptide or glycomacropeptide have been described by Neeser [US patent Nos. 4,992,420 and 4,994,441] as anti-plaque and anti-carries agents by virtue of the oligosaccharide chains linked to threonine residues of the peptide. Neeser claims that the oligosaccharide chains of the glycopeptide, by specifically binding to plaque-forming oral bacteria, block

10 the adherence of these bacteria onto salivary-coated tooth enamel. The glycosylated forms of  $\kappa$ -casein (106-169) can be separated from the non-glycosylated forms by chromatography (eg. anion exchange and reversed-phase HPLC) or by selective precipitation or ultrafiltration. Only the non-glycosylated forms of  $\kappa$ -casein (117-169) or  $\kappa$ -casein (106-169)

15 showed antimicrobial activity. As glycosylation destroys antimicrobial activity it is desirable to separate the glyco- and aglyco-forms of  $\kappa$ -casein (117-169) or  $\kappa$ -casein (106-169) which can be achieved using chromatography, selective precipitation or ultrafiltration. Phosphorylation of Ser<sup>149</sup> and to a lesser extent Ser<sup>127</sup> are important for antimicrobial activity

20 and the phosphorylated forms of the two major genetic variants (A and B) appear to possess equal activity [Table 1]. The Neeser patents do not disclose the antimicrobial activity of  $\kappa$ -casein(106-169) nor the use of the non-glycosylated forms of the peptide for the suppression of bacterial pathogens.

25 In a particularly preferred embodiment of the invention, the antimicrobial peptide is incorporated into dentifrices such as toothpaste, mouth washes or formulations for the mouth to aid in the prevention and/or treatment of dental caries and periodontal diseases. The peptide may comprise 0.01-50% by weight of the composition, preferably 0.1-10%. For

30 oral compositions it is preferred that the amount of the peptide administered is 0.01 -50% by weight, preferably 0.1-10% by weight of the composition. The oral composition of this invention which contains the above-mentioned peptides may be prepared and used in various forms applicable to the mouth such as dentifrice including toothpastes, toothpowders and liquid dentifrices,

35 mouthwashes, troches, chewing gums, dental pastes, gingival massage creams, gargle tablets, lozenges, dairy products and other foodstuffs. The

oral composition according to this invention may further include additional well known ingredients depending on the type and form of a particular oral composition.

In certain highly preferred forms of the invention the oral  
5 composition may be substantially liquid in character, such as a mouthwash or rinse. In such a preparation the vehicle is typically a water-alcohol mixture desirably including a humectant as described below. Generally, the weight ratio of water to alcohol is in the range of from about 1:1 to about 20:1. The total amount of water-alcohol mixture in this type of preparation is  
10 typically in the range of from about 70 to about 99.9% by weight of the preparation. The alcohol is typically ethanol or isopropanol. Ethanol is preferred.

The pH of such liquid and other preparations of the invention is generally in the range of from about 4.5 to about 9 and typically from about  
15 5.5 to 8. The pH is preferably in the range of from about 6 to about 8.0, preferably 7.4. The pH can be controlled with acid (e.g. citric acid or benzoic acid) or base (e.g. sodium hydroxide) or buffered (as with sodium citrate, benzoate, carbonate, or bicarbonate, disodium hydrogen phosphate, sodium dihydrogen phosphate, etc).

20 Other desirable forms of this invention, the oral composition may be substantially solid or pasty in character, such as toothpowder, a dental tablet or a dentifrice, that is a toothpaste (dental cream) or gel dentifrice. The vehicle of such solid or pasty oral preparations generally contains dentally acceptable polishing material. Examples of polishing materials are  
25 water-insoluble sodium metaphosphate, potassium metaphosphate, tricalcium phosphate, dihydrated calcium phosphate, anhydrous dicalcium phosphate, calcium pyrophosphate, magnesium orthophosphate, trimagnesium phosphate, calcium carbonate, hydrated alumina, calcined alumina, aluminium silicate, zirconium silicate, silica, bentonite, and  
30 mixtures thereof. Other suitable polishing material include the particulate thermosetting resins such as melamine-, phenolic, and urea-formaldehydes, and cross-linked polyepoxides and polyesters. Preferred polishing materials include crystalline silica having particle sized of up to about 5 microns, a mean particle size of up to about 1.1 microns, and a surface area of up to  
35 about 50,000 cm<sup>2</sup>/gm., silica gel or colloidal silica, and complex amorphous alkali metal aluminosilicate.

When visually clear gels are employed, a polishing agent of colloidal silica, such as those sold under the trademark SYLOID as Syloid 72 and Syloid 74 or under the trademark SANTOCEL as Santocel 100, alkali metal alumino-silicate complexes are particularly useful since they have refractive indices close to the refractive indices of gelling agent-liquid (including water and/or humectant) systems commonly used in dentifrices.

Many of the so-called "water insoluble" polishing materials are anionic in character and also include small amounts of soluble material. Thus, insoluble sodium metaphosphate may be formed in any suitable manner as illustrated by Thorpe's Dictionary of Applied Chemistry, Volume 9, 4th Edition, pp. 510-511. The forms of insoluble sodium metaphosphate known as Madrell's salt and Kurrol's salt are further examples of suitable materials. These metaphosphate salts exhibit only a minute solubility in water, and therefore are commonly referred to as insoluble metaphosphates (IMP). There is present therein a minor amount of soluble phosphate material as impurities, usually a few percent such as up to 4% by weight. The amount of soluble phosphate material, which is believed to include a soluble sodium trimetaphosphate in the case of insoluble metaphosphate, may be reduced or eliminated by washing with water if desired. The insoluble alkali metal metaphosphate is typically employed in powder form of a particle size such that no more than 1% of the material is larger than 37 microns.

The polishing material is generally present in the solid or pasty compositions in weight concentrations of about 10% to about 99%. Preferably, it is present in amounts from about 10% to about 75% in toothpaste, and from about 70% to about 99% in toothpowder. In toothpastes, when the polishing material is silicious in nature, it is generally present in amount of about 10-30% by weight. Other polishing materials are typically present in amount of about 30-75% by weight.

In a toothpaste, the liquid vehicle may comprise water and humectant typically in an amount ranging from about 10% to about 80% by weight of the preparation. Glycerine, propylene glycol, sorbitol and polypropylene glycol exemplify suitable humectants/carriers. Also advantageous are liquid mixtures of water, glycerine and sorbitol. In clear gels where the refractive index is an important consideration, about

2.5 - 30% w/w of water, 0 to about 70% w/w of glycerine and about 20-80% w/w of sorbitol are preferably employed.

Toothpaste, creams and gels typically contain a natural or synthetic thickener or gelling agent in proportions of about 0.1 to about 10, preferably about 0.5 to about 5% w/w. A suitable thickener is synthetic hectorite, a synthetic colloidal magnesium alkali metal silicate complex clay available for example as Laponite (e.g. CP, SP 2002, D) marketed by Laporte Industries Limited. Laponite D is, approximately by weight 58.00% SiO<sub>2</sub>, 25.40% MgO, 3.05% Na<sub>2</sub>O, 0.98% Li<sub>2</sub>O, and some water and trace metals. Its true specific gravity is 2.53 and it has an apparent bulk density of 1.0 g/ml at 8% moisture.

Other suitable thickeners include Irish moss, iota carrageenan, gum tragacanth, starch, polyvinylpyrrolidone, hydroxyethylpropylcellulose, hydroxybutyl methyl cellulose, hydroxypropyl methyl cellulose, hydroxyethyl cellulose (e.g. available as Natrosol), sodium carboxymethyl cellulose, and colloidal silica such as finely ground Syloid (e.g. 244). Solubilizing agents may also be included such as humectant polyols such propylene glycol, dipropylene glycol and hexylene glycol, cellosolves such as methyl cellosolve and ethyl cellosolve, vegetable oils and waxes containing at least about 12 carbons in a straight chain such as olive oil, castor oil and petrolatum and esters such as amyl acetate, ethyl acetate and benzyl benzoate.

It will be understood that, as is conventional, the oral preparations are to be sold or otherwise distributed in suitable labelled packages. Thus, a jar of mouthrinse will have a label describing it, in substance, as a mouthrinse or mouthwash and having directions for its use; and a toothpaste, cream or gel will usually be in a collapsible tube, typically aluminium, lined lead or plastic, or other squeeze, pump or pressurized dispenser for metering out the contents, having a label describing it, in substance, as a toothpaste, gel or dental cream.

Organic surface-active agents are used in the compositions of the present invention to achieve increased prophylactic action, assist in achieving thorough and complete dispersion of the active agent throughout the oral cavity, and render the instant compositions more cosmetically acceptable. The organic surface-active material is preferably anionic, nonionic or ampholytic in nature which does not denature the antimicrobial peptide of the invention, and it is preferred to employ as the surface-active

agent a deterative material which imparts to the composition deterative and foaming properties while not denaturing the peptide. Suitable examples of anionic surfactants are water-soluble salts of higher fatty acid monoglyceride monosulfates, such as the sodium salt of the monosulfated monoglyceride of hydrogenated coconut oil fatty acids, higher alkyl sulfates such as sodium lauryl sulfate, alkyl aryl sulfonates such as sodium dodecyl benzene sulfonate, higher alkylsulfo-acetates, higher fatty acid esters of 1,2-dihydroxy propane sulfonate, and the substantially saturated higher aliphatic acyl amides of lower aliphatic amino carboxylic acid compounds, such as those having 12 to 16 carbons in the fatty acid, alkyl or acyl radicals, and the like. Examples of the last mentioned amides are N-lauroyl sarcosine, and the sodium, potassium, and ethanolamine salts of N-lauroyl, N-myristoyl, or N-palmitoyl sarcosine which should be substantially free from soap or similar higher fatty acid material. The use of these sarconite compounds in the oral compositions of the present invention is particularly advantageous since these materials exhibit a prolonged marked effect in the inhibition of acid formation in the oral cavity due to carbohydrates breakdown in addition to exerting some reduction in the solubility of tooth enamel in acid solutions. Examples of water-soluble nonionic surfactants suitable for use with peptides are condensation products of ethylene oxide with various reactive hydrogen-containing compounds reactive therewith having long hydrophobic chains (e.g. aliphatic chains of about 12 to 20 carbon atoms), which condensation products ("ethoxamers") contain hydrophilic polyoxyethylene moieties, such as condensation products of poly (ethylene oxide) with fatty acids, fatty alcohols, fatty amides, polyhydric alcohols (e.g. sorbitan monostearate) and polypropyleneoxide (e.g. Pluronic materials).

Surface active agent is typically present in amount of about 0.1-5% by weight. It is noteworthy, that the surface active agent may assist in the dissolving of the peptide of the invention and thereby diminish the amount of solubilizing humectant needed.

Various other materials may be incorporated in the oral preparations of this invention such as whitening agents, preservatives, silicones, chlorophyll compounds and/or ammoniated material such as urea, diammonium phosphate, and mixtures thereof. These adjuvants, where present, are incorporated in the preparations in amounts which do not substantially adversely affect the properties and characteristics desired.

Any suitable flavouring or sweetening material may also be employed. Examples of suitable flavouring constituents are flavouring oils, e.g. oil of spearmint, peppermint, wintergreen, sassafras, clove, sage, eucalyptus, marjoram, cinnamon, lemon, and orange, and methyl salicylate.

5 Suitable sweetening agents include sucrose, lactose, maltose, sorbitol, xylitol, sodium cyclamate, perillartine, AMP (aspartyl phenyl alanine, methyl ester), saccharine, and the like. Suitably, flavour and sweetening agents may each or together comprise from about 0.1% to 5% more of the preparation.

In the preferred practice of this invention an oral composition  
10 according to this invention such as mouthwash or dentifrice containing the composition of the present invention is preferably applied regularly to the gums and teeth, such as every day or every second or third day or preferably from 1 to 3 times daily, at a pH of about 4.5 to about 9, generally about 5.5 to about 8, preferably about 6 to 8, for at least 2 weeks up to 8 weeks or more up  
15 to a lifetime.

The compositions of this invention can be incorporated in lozenges, or in chewing gum or other products, e.g. by stirring into a warm gum base or coating the outer surface of a gum base, illustrative of which may be mentioned jelutong, rubber latex, vinylite resins, etc., desirably with  
20 conventional plasticisers or softeners, sugar or other sweeteners or such as glucose, sorbitol and the like.

In another embodiment, the peptide of the invention is formulated in foods to act as a preservative preferably comprising 0.01-10% w/w, more preferably 0.1-5% w/w, most preferably 1-5% and particularly 2% w/w.

25 The present invention provides compositions including pharmaceutical compositions comprising the antimicrobial peptide as described together with a pharmaceutically-acceptable carrier. Such compositions may be selected from the group consisting of dental, intra-oral compositions, therapeutic anti-infective compositions for topical and  
30 systemic application. Dental compositions or therapeutic compositions may be in the form of a gel, liquid, solid, powder, cream or lozenge. Therapeutic compositions may also be in the form of tablets or capsules.

The present invention also provides a method of treating or  
preventing dental caries or periodontal disease comprising the step of  
35 administering a peptide or composition of the invention to the teeth or gums

of a subject in need of such treatments. Topical administration of the peptide is preferred.

The invention also provides a method of producing the antimicrobial peptide from casein or whey.  $\kappa$ -casein (106-169) can be obtained from cheese or rennet whey by ultrafiltration or acid precipitation. Ultrafiltration of whey through a 10,000 - 30,000 nominal molecular weight cut off (NMCO) membrane filter at neutral or preferably acidic pH (3-5) retains the majority of whey proteins producing a permeate rich in casein peptides, lactose and minerals. Ultrafiltration and concentration of the permeate using a 1000 NMCO membrane filter produces a fraction rich in  $\kappa$ -casein (106-169). This fraction is then incubated with trypsin and the resulting hydrosylate subjected to reversed-phase HPLC producing a relatively pure  $\kappa$ -casein (117-169) peptide. Alternatively the peptides  $\kappa$ -casein (117-169) and  $\beta$ (184-202) can be obtained from a tryptic digest of casein using reversed-phase HPLC. Peptide  $\kappa$ -casein (138-158) can be obtained by a partial endo-Glu-C digest of  $\kappa$ -casein (106-169) followed by purification using reversed-phase HPLC.

It will be clearly understood that, although this specification refers specifically to applications in humans, the invention is also useful for veterinary purposes. Thus in all aspects the invention is useful for domestic animals such as cattle, sheep, horses and poultry; for companion animals such as cats and dogs; and for zoo animals.

In order that the nature of the present invention may be more clearly understood preferred forms thereof will now be described with reference to the following non-limiting examples.

## FIGURE LEGENDS

Figure 1. Reversed-phase HPLC of a tryptic digest of a Whey Protein Concentrate (WPC). The WPC tryptic digest (8 mg) was applied to a Brownlee RP-300 C<sub>8</sub> column. The sample was eluted using a stepwise linear gradient of 0 - 20% B in 2 min followed by 20 - 45% B in 40 min at a flow rate of 1 ml/min. Eluant A was 0.1% (v/v) TFA in water and eluant B was 80% (v/v) acetonitrile in 0.1% (v/v) TFA in water.

Figure 2. Anion exchange chromatography of peak 9 from RP-HPLC of the WPC tryptic digest. Peak 9 was applied to a Mono Q column attached to a SMART™ system and eluted using 0 - 75% elutant B in 40 min at a flow rate of 100 µl/min. Elutant A was 20 mM Tris-HCl pH 8.0 , 10 mM KCl and  
5 elutant B was 20 mM Tris-HCl pH 8.0, 500 mM KCl.

Figure 3. Determination of the MIC of κ-casein A Ser(P)<sup>149</sup> (f117-169) for *Streptococcus mutans* Ingbritt. The MIC was 2.4 µM.

10 Figure 4. Analytical reversed-phase HPLC elution profile of UF-whey. A sample of UF-whey was dissolved in solvent A and applied to an analytical column (C18) and then eluted using a linear gradient from 0-35% Solvent B in 5 min followed by 35-80% Solvent B in 40 min at a flow rate of 1.0 ml/min. Solvent A consisted of 0.1% TFA in water and Solvent B  
15 contained 90% acetonitrile (v/v/0.1% TFA in water). Peaks were detected at 215 nm, collected manually at 215 nm and lyophilised.

Figure 5. Purification of peak 4 (from RP-HPLC) using gel filtration. Peak 4 was applied to a gel filtration column connected to an ABI system.  
20 Material was eluted using 30% acetonitrile (v/v)/0.1% TFA at a flow rate of 1 ml/min and monitored at 215 nm.

Figure 6. Purification of peptides generated by the hydrolysis of TCA-soluble UF-whey by endopeptidase Glu-C. A sample was dissolved in  
25 Solvent A (0.1% TFA v/v in water) and applied to an analytical column (C18). Peaks were eluted using a gradient of 0-20% Solvent B (90% acetonitrile v/v/0.1% TFA in water) in 4 min followed by 20%-40% Solvent B in 40 min. Peaks were monitored at 215 nm.

30 Specific examples of formulations containing the antimicrobial peptide of the invention are provided below.

**EXAMPLE 1***Preparation of antimicrobial peptides from a tryptic digest of whey protein concentrate*

5           Whey protein concentrate (50 mg/ml) in water (pH 8.0) was hydrolysed using Novo trypsin (1 mg/ml) at 50°C for 2 h with the pH maintained at  $8.00 \pm 0.01$  by the addition of 1N NaOH. Hydrolysis was terminated by the addition of 1M HCl to pH 4.6. The hydrolysate was centrifuged (11,600 g for 10 min) and then filtered through a 0.2  $\mu$ m PVDF  
10 filter before being applied to a 7  $\mu$ m C<sub>8</sub> (Brownlee) reversed-phase column (4.6 x 220 mm). The sample was eluted using an Applied Biosystems 140 A Solvent Delivery System to generate a stepwise linear gradient from 0-20% B in 2 min followed by 20-45% B in 40 min at a flow rate of 1 ml/min. Eluant A was 0.1% (v/v) TFA in water and eluant B was 80% (v/v) acetonitrile,  
15 0.1% (v/v) TFA in water. The eluant was monitored using an Applied Biosystems 1000S Diode Array detector at a primary wavelength of 215 nm. The chromatogram obtained is shown in Fig. 1. Peaks were collected and assayed for antimicrobial activity. Antimicrobial assays were carried out in liquid growth medium using sterile 96 well plates, each well having a  
20 capacity of 300  $\mu$ L. The growth medium consisted of Todd Hewit broth (36.4 g/L), Yeast Extract (5.0 g/L) with 100 mmol/L potassium phosphate buffer. Routinely the pH of the growth medium was adjusted to 6.3. An inoculum of approximately  $1.5 \times 10^2$  cells (*Streptococcus sanguis*, *Streptococcus mutans*, *Porphyromonas gingivalis*) that had been harvested  
25 during the exponential phase of growth, was added to each well. The ionophore gramicidin (40  $\mu$ mol/L final concentration) was added to a series of wells as a negative control. Positive controls contained only the inoculum and the growth medium. Growth was determined over a 30 hour period after inoculation by measuring the optical density of the cell suspensions at a  
30 wavelength of 650 nm (OD<sub>650</sub>), using a microplate reader (Biorad, model 450). Growth was determined by subtracting the initial reading, taken immediately after inoculation from the final reading (maximum culture OD).

Antimicrobial assays were also carried out on agar plates containing suitable growth media that had been inoculated with a lawn of the test  
35 bacterial species. Filter paper discs (6 mm diameter), to which was added 50  $\mu$ L of the peptide solution, were placed on the surface of the agar plate.

The diameter of the zone of growth inhibition around each disc was determined after three days of incubation and compared to a control that only had buffer added. Growth conditions depended on the bacterial species being tested, however they were routinely cultured in an anaerobic work station at 37 °C. Only peak 9 of Fig. 1 exhibited antimicrobial activity. Analysis of this peak using amino acid sequence analysis (Hewlett Packard automated protein sequencer) and mass analysis (Perseptive Voyager MALDI-TOF mass spectrometer) revealed that the peak was heterogenous and so the sample was subjected to anion exchange chromatography on a Mono Q PC 1.6/5 (10 µm) column attached to a SMART™ (Pharmacia) system. The sample was eluted using a linear gradient from 0-75% B in 40 min at a flow rate of 100 µl/min. Eluant A was 20 mM Tris-HCl pH 8.0, 10 mM KCl. Eluant B was 20 mM Tris-HCl pH 8.0, 500 mM KCl. The eluant was monitored at 215 and 280 nm using the µ Peak monitor. The anion exchange chromatogram for peak 9 from RP-HPLC is shown in Fig. 2. Peaks were collected and assayed for antimicrobial activity and only peaks 9, 10 and 11 exhibited activity. N-terminal sequence and mass analyses revealed that fraction 9 contained Ser(P)<sup>149</sup> κ-casein A (113-169), fraction 10 contained Ser(P)<sup>149</sup> κ-casein A (124-169) and fraction 11 contained Ser(P)<sup>149</sup> κ-casein A (117-169). Mass analysis revealed that none of the peptides were glycosylated. The minimum inhibitory concentration (MIC) of pure Ser(P)<sup>149</sup> κ-casein A (117-169) was then determined for the bacterium *Streptococcus mutans* and is shown in Fig. 3. The MIC obtained was 2.4 µM.

## EXAMPLE 2

### A. Preparation of antimicrobial peptides from cheese whey

Cheese whey was ultrafiltered (UF) through a 20,000 molecular weight cut off membrane. The filtrate was collected and proteins were precipitated by addition of trichloroacetic acid (TCA) to a final concentration of 11% w/v. Precipitated proteins were removed by centrifugation (10,000g, 5 min) and the neutralised supernatant was lyophilised. The dried TCA-soluble UF whey was dissolved in 0.1% TFA in water and subjected to RP-HPLC. The sample was applied to a Brownlee aquapore analytical (C18) reversed-phase column (220 x 4.6 mm) or a Brownlee (C18) preparative column (25 cm x 10 mm). Solvent B consisted of 90% acetonitrile containing 0.1 % v/v TFA and

solvent A consisted of 0.1% TFA in water. The eluant was monitored using an Applied Biosystems Incorporated (ABI; Melbourne, Vic., Australia) 1000S diode array detector at a wavelength of 215 nm.

The sample was applied to the Brownlee analytical column and  
5 eluted using a gradient from 0-35% solvent B in 2 min, 35% solvent B in 2 min followed by 35-80% solvent B in 40 min at a flow rate of 1.0 ml/min. Fractions collected were assayed for antibacterial activity. Fractions were tested with the Gram-positive bacteria *Streptococcus mutans* Ingbritt, *Streptococcus sanguinis* (formerly *S. sanguis*), *Streptococcus sobrinus* 6715  
10 WT15, *Staphylococcus aureus* ATCC 25923 and the Gram-negative bacteria, *Escherichia coli* NCTC 10418, *Salmonella typhimurium* ATCC 13311, and *Pseudomonas aeruginosa* ATCC 25619. The bacteria were stored in 30% glycerol broths at -20°C.

The antibacterial assay was conducted in sterile 96 well plates  
15 (Becton Dickinson, Melbourne, Australia). The growth media for the Gram-positive bacteria consisted of Todd Hewitt broth (TH; 36.4 g/l), Yeast extract (YE; 5 g/l) and 100 mM potassium phosphate, pH 6.28 (TYPB). The media for Gram-negative bacteria consisted of Nutrient broth at pH 6.28 and for *P. gingivalis*, Brain Heart Infusion media (with 1µg/ml haeme and 0.5g/l  
20 cysteine) at pH 7.0. An inoculum was prepared by diluting exponentially growing cells in growth media, such that the inoculum contained approximately  $2.7 \times 10^4$  viable cells/ml. To each well was added 250 µl media containing the peptide in varying concentrations and 50 µl of bacterial inoculum. Control assays contained all components except peptide. The  
25 negative control wells each contained 250 µl media, 50 µl inoculum and 5 µl of gramicidin D (2.5 mM). Growth of the bacterium was determined as the difference between the final and initial Optical Density (OD) 650 nm readings using a microplate reader (BIORAD, model 450, NSW, Australia). The final OD represented the maximum culture OD and was recorded  
30 normally 20-30 h after inoculation, during which time the cells were incubated at 37°C in aerobic conditions except for *P. gingivalis* which was incubated in anaerobic conditions at the same temperature. The minimal inhibitory concentration (MIC) was determined as the lowest concentration of peptide required to inhibit the growth of the bacterium. The peptide  
35 concentration varied between 0.05 µM-500 µM

The antimicrobial activity of the neutralised starting material (TCA-soluble UF whey) is shown in Table 2.

**Table 2. Growth inhibition of Gram-positive and Gram-negative bacteria by TCA-soluble UF-whey. Microbial growth was determined by optical density at a wavelength of 650 nm after 30 h incubation at 37°C.**

10 The four peaks were also analysed by amino acid sequence analysis and by mass spectrometry.

Mass spectrometric analysis (MS) of peptides was performed using a  
 Perspective Biosystems (Framingham, MA, USA) Voyager linear matrix  
 15 assisted laser desorption/ionisation Time of Flight (MALDI-TOF) mass  
 spectrometer equipped with delayed extraction. Samples were mixed  
 (1:1 v/v) on the sample analysis plate with a 5 mg/ml solution of 2-5,  
 dihydroxybenzoic acid in 50% aqueous acetonitrile, containing 0.25% v/v  
 TFA in water. All spectra were obtained in linear, positive mode with an  
 20 accelerating voltage of 20 kV, grid voltage of 92% and pulse delay time of 125  
 ns. Calibration was performed using bovine insulin (MW 5733.54 Da). For  
 sequence analysis peptides were applied to a preconditioned  
 Hewlett-Packard (HP; Blackburn, Vic, Aust.) sequencing column in 1 ml of  
 sample loading solution (2% v/v TFA in water) and then analysed using a HP  
 25 G1005A Protein sequencer.

RP4GF3	-	-	α-lactalbumin
RP4GF4	6758	6755	Ser(P) <sup>149</sup> κ-casein-B-(106-169)
	6788	6787	Ser(P) <sup>149</sup> κ-casein-A-(106-169)
	6738	6835	Ser(P) <sup>127</sup> , Ser(P) <sup>149</sup> κ-casein-B-(106-169)
	6869	6867	Ser(P) <sup>127</sup> , Ser(P) <sup>149</sup> κ-casein-A-(106-169)

5 † - Assigned by N-terminal amino acid sequencing

The two gel filtration peaks with the same specific antimicrobial activity RP4 GF1 and RP4 GF4 (Table 4) contained the same peptides, presumably the higher molecular weight fraction RP4 GF1, represented an aggregated state of the phosphopeptides. The active peptides were identified as:

15 Ser(P)<sup>149</sup>κ-casein-B-(106-169)  
 Ser(P)<sup>149</sup>κ-casein-A-(106-169)  
 Ser(P)<sup>127</sup>, Ser(P)<sup>149</sup>κ-casein-B-(106-169)  
 15 Ser(P)<sup>127</sup>, Ser(P)<sup>149</sup>κ-casein-A-(106-169)

The identification of antimicrobial activity with the phosphorylated, non-glycosylated form of κ-casein (106-169) is consistent with the identification of the tryptic casein peptide Ser(P)<sup>149</sup>κ-casein (117-169) as an antimicrobial peptide in Example 1.

*B. Preparation of antimicrobial peptides from TCA-soluble UF whey treated with endopeptidase Glu-C*

Endopeptidase Glu-C (Sigma Chemical Co, St. Louis, MO, USA) was added (5.0 µg/ml) to a solution of TCA-soluble UF-whey (1.0 mg/ml), in ammonium acetate (0.05 M, pH 4.0) and incubated at 37°C for 24 h. The reaction was stopped by lowering the pH to 3.0 by the addition of glacial acetic acid. Enzymatic digestion products were separated by RP-HPLC.

Fig. 6 shows the RP-HPLC of the endo Glu-C digest of TCA-soluble UF whey. Twelve peaks were collected and only peak 12 exhibited antimicrobial activity against *S. mutans* as shown in Table 6. Peak 12 contained three peptides as shown by sequence and mass spectrometric analyses (Table 7). These peaks were further purified by analytical RP-HPLC and only peptide Ser(P)<sup>149</sup> κ-casein A (138-158) exhibited antimicrobial activity with a 100 µM concentration giving close to 100% growth inhibition of *S. mutans*.

**Table 6. Antimicrobial activity against *S. mutans* of lyophilised peaks 9-12 from RP-HPLC of an endo Glu-C hydrolysate of TCA-soluble UF-whey.**

Peak	Amount <sup>†</sup> (mg)	Assay Concentration <sup>∞</sup> (mg/ml)	% Growth inhibition
9	0.64	0.53	NI <sup>a</sup>
10	0.30	0.25	NI
11	0.32	0.27	NI
12	0.40	0.34	84±9 <sup>b</sup>

a - no inhibition

b - % mean inhibition of growth ± standard deviation (n=3)

† - Amount of each peak estimated by 215nm absorbance

∞ - Concentration of peak in antibacterial assay

**Table7. Composition of peaks 9-12 from RP-HPLC of an endo Glu-C hydrolysate of TCA-soluble UF-whey.**

Peak	Measured Molecular mass (Da) <sup>a</sup>	Calculated Molecular mass (Da)	Assignment

	4385.3	4379.0	κ-casein-B-1 GalNAc, 1 Gal, 1 NeuAc-(106-140)
12	2285.6	2279.3	Ser (P) <sup>149</sup> κ-casein-A-(138-158)
	2356.8	2348.4	Ser (P) <sup>149</sup> κ-casein-B-(148-169)
	2398.3	2392.5	Ser (P) <sup>149</sup> κ-casein-A-(148-169)

a - molecular mass determined by MS

These results showed that only a 20 residue fragment of Ser(P)<sup>149</sup> κ-casein A (106-169), Ser(P)<sup>149</sup> κ-casein A (138-158) displayed antimicrobial activity albeit less potent (100 μM MIC) compared with the longer peptide (2.5 μM MIC). The twenty residue fragment of the two major genetic variants A and B are shown:

Ser(P)<sup>149</sup> κ-casein A (138-158) AVESTVATLEDΣPEVIESPP

Ser(P)<sup>149</sup> κ-casein B (138-158) AVESTVATLEAΣPEVIESPP

The twenty residue fragment is amphipathic and has the potential to form an amphipathic helix and therefore a channel in the bacterial membrane. A molecular model of κ-casein (130-158) as a hexamer forming a polar channel with a non-polar exterior that could allow the passage of cations (Na<sup>+</sup>, K<sup>+</sup>, H<sup>+</sup> etc.) through a bacterial cell membrane thereby dissipating transmembrane electrochemical gradients was constructed. It was interesting to note that the molecular model of the glycosylated form of κ-casein (130-158), which has no antimicrobial activity, has the channel blocked by sugar residues perhaps thereby possibly explaining the lack of activity with the glycosylated peptides.

### C. *Synthesis of Ser(P)<sup>149</sup> κ-casein (138- 160)*

To confirm antimicrobial activity of Ser(P)<sup>149</sup> κ-casein (138-158) related peptides were synthesised with and without the phosphorylation and assayed for antimicrobial activity.

A peptide corresponding to Ser(P)<sup>149</sup> κ-casein A (138-160), containing a phosphoryl group on Ser 149, and κ-casein A (130-158) were synthesised manually by standard solid-phase peptide synthesis protocols for Fmoc chemistry. The peptides were assembled as the carboxyl form using Pac-Peg-PS resin (PerSeptive Biosystems). Subsequent additions of the remaining Fmoc amino acids including Fmoc-Ser(PO(OBzl)OH)-OH were accomplished with HBTU/HOBt activation using 4 equiv of Fmoc-amino acid and 6 equiv of DIPEA. The Fmoc group was removed with a continuous flow of 2% v/v DBU in DMF containing 2% v/v piperidine for 5 min. Cleavage of the peptide from the resin support was performed using TFA:TIPS:water (95:2.5:2.5) cleavage cocktail for 2.5 h under N<sub>2</sub>, in darkness. After cleavage the resin was removed by filtration and the filtrate concentrated under a stream of nitrogen. After the peptide products were precipitated in cold

ether, they were centrifuged and washed three times. The peptide precipitate was then dissolved in water containing 0.1% v/v TFA and insoluble residue removed by centrifugation.

Purification of synthesised peptides was performed using a Brownlee C18 preparative column. Chromatograms were developed at a flow rate of 4.0 ml/min and peptides were eluted using a gradient of 0-100 % solvent B in 43 min. Peptide fractions collected from the column were applied to the Brownlee C18 analytical column and eluted using a gradient of 0-100% solvent B in 40 min.

All collected peptide fractions were lyophilised and subjected to analysis by MS.

Table 8 shows the antimicrobial activity of the two synthetic peptides. These results show that the phosphorylation of Ser<sup>149</sup> is essential for full antimicrobial activity. The phosphoserine residue Ser(P)<sup>149</sup> may be necessary for the formation of an ion channel in the bacterial membrane or maybe necessary for solubility. Further, the higher MIC (100-150  $\mu$ M) for the Ser(P)<sup>149</sup>  $\kappa$ -casein A (138-160) compared with the larger peptide Ser(P)<sup>149</sup>  $\kappa$ -casein A (117-169) (2.5  $\mu$ M MIC) suggests that the flanking residues of Ser(P)<sup>149</sup>  $\kappa$ -casein (138-158) may be necessary for solubility and/or interaction with the bacterial cell and formation of the ion channel.

**Table 8. Inhibition of *S. mutans* growth by synthetic peptides  $\kappa$ -casein-A-(130-158) (non-phosphorylated) and Ser (P)<sup>149</sup>  $\kappa$ -casein-A-(138-160).**

Peptide	MIC	% Growth inhibition				
		Concentration of synthetic peptides (mM)				
		100	75	50	25	10
$\kappa$ -casein-A-(130-158)	1.2 mM	17 $\pm$ 13 <sup>a</sup>	- <sup>b</sup>	14 $\pm$ 13	11 $\pm$ 7	NI <sup>c</sup>
Ser (P) <sup>149</sup> $\kappa$ -casein-A-(138-160)	150 $\mu$ M	-	69 $\pm$ 6	52 $\pm$ 5	17 $\pm$ 9	6 $\pm$ 10

a - % mean inhibition of growth  $\pm$  standard deviation (n=3-6)

b - not determined

c - no inhibition

**EXAMPLE 3****A. Trypsin hydrolysis**

Sodium caseinate was dissolved in 150 mM  $\text{NH}_4\text{HCO}_3$  pH 8.0 at 10%  
5 (w/v) and hydrolysed using Novo trypsin (2 g/L) at 50 °C for 2 h. Hydrolysis  
was terminated by the addition of 1N HCl to pH 4.6 and the undigested  
protein removed by centrifugation. A sample of the hydrolysate was applied  
to a 7  $\mu\text{m}$  Applied Biosystems  $\text{C}_8$  column (4.6 x 220 mm) and eluted as  
described in Example 1. Peaks were collected and assayed for antimicrobial  
10 activity against *Streptococcus sanguinis*. Two peptides showed activity,  
 $\text{Ser(P)}^{149}$   $\kappa$ -casein (117-169) and  $\beta$ -casein (184-702).

**B. Rennet hydrolysis**

15 Casein HCl (5 g) was dissolved in 100 ml of 100 mM ammonium  
bicarbonate pH 8.0. Once the casein had dissolved the pH was lowered to 6.3  
with 1 M HCl and 1 mg of rennet (chymosin, Sigma) was added and the  
mixture incubated for 1 h at 37°C. TCA (11% w/v) was added to the solution  
or the pH was lowered to 4.5 by the addition of 1 M HCl and the precipitated  
20 proteins were removed by centrifugation. The supernatant was collected,  
neutralised and lyophilised. The dried sample was dissolved in solvent A  
(0.1% TFA in water) and applied to a Brownlee C18 preparative RP-HPLC  
column. The column was eluted using a gradient of 15% solvent B for 5 min  
15-60% solvent B in 225 min followed by 60-100% solvent B in 1 min at a  
25 flow rate of 4.0 ml/min. The eluant was monitored at 215 nm. Four peaks  
were obtained two of which had antimicrobial activity and corresponded to  
the non-glycosylated, phosphorylated  $\kappa$ -casein (106-169).

The active peptides were identified as:-

30  $\text{Ser(P)}^{149}$   $\kappa$ -casein A (106-169).  
 $\text{Ser(P)}^{127}$ ,  $\text{Ser(P)}^{149}$   $\kappa$ -casein A (106-169)  
and  
 $\text{Ser(P)}^{149}$   $\kappa$ -casein B (106-169).  
 $\text{Ser(P)}^{127}$ ,  $\text{Ser(P)}^{149}$   $\kappa$ -casein B (106-169).

**EXAMPLE 4 - PROPOSED TOOTHPASTE FORMULATIONS****Formulation 1**

In each of the above sequences  $\Sigma$  represent phosphoseryl.

## CLAIMS:-

1. An antimicrobial peptide, the peptide being non-glycosylated, less than about 100 amino acids and including an amino acid sequence selected from the group consisting of:-
  - 5 AVESTVATLEA $\Sigma$ PEVIESPPE, (SEQ. ID. NO. 1)
  - AVESTVATLED $\Sigma$ PEVIESPPE, (SEQ. ID. NO. 2)
  - AVESTVATLEASPEVIESPPE, (SEQ. ID. NO. 3)
  - AVESTVATLEDSPEVIESPPE, (SEQ. ID. NO. 4)
  - 10 DMPIQAFLLYQQPVLGPVR. (SEQ. ID. NO. 5)
 and conservative substitutions therein.
2. An antimicrobial peptide as claimed in claim 1 in which the peptide includes an amino acid sequence selected from the group consisting of:-
  - 15 AVESTVATLEA $\Sigma$ PEVIESPPE, (SEQ. ID. NO. 1)
  - AVESTVATLED $\Sigma$ PEVIESPPE, (SEQ. ID. NO. 2)
  - AVESTVATLEASPEVIESPPE, (SEQ. ID. NO. 3)
  - AVESTVATLEDSPEVIESPPE, and (SEQ. ID. NO. 4)
  - DMPIQAFLLYQQPVLGPVR. (SEQ. ID. NO. 5)
3. An antimicrobial peptide as claimed in claim 1 or claim 2 in which the peptide is less than about 70 amino acids.
4. An microbial peptide as claimed in any one of claims 1 to 3 in which the peptide includes an amino acid sequence selected from the group consisting of:-
  - 25 MAIPPKKNQDKTEIPTINTIASGEPTSTPTIEAVESTVATLEA $\Sigma$ PEVIESPPEINT VQVTSTAV; (SEQ. ID. NO. 6)
  - MAIPPKKNQDKTEIPTINTIA $\Sigma$ GEPTSTPTIEAVESTVATLEA $\Sigma$ PEVIESPPEINT VQVTSTAV; (SEQ. ID. NO. 7)
  - MAIPPKKNQDKTEIPTINTIASGEPTSTPTTEAVESTVATLED $\Sigma$ PEVIESPPEINT VQVTSTAV; (SEQ. ID. NO. 8)
  - 30 MAIPPKKNQDKTEIPTINTIA $\Sigma$ GEPTSTPTTEAVESTVATLED $\Sigma$ PEVIESPPEINT VQVTSTAV; (SEQ. ID. NO. 9)
  - TEIPTINTIASGEPTSTPTIEAVESTVATLEA $\Sigma$ PEVIESPPEINTVQVTSTAV; (SEQ. ID. NO. 10)
  - TEIPTINTIA $\Sigma$ GEPTSTPTIEAVESTVATLEA $\Sigma$ PEVIESPPEINTVQVTSTAV; (SEQ. ID. NO. 11)

TEIPTINTIASGEPTSTPTTEAVESTVATLEDΣPEVIESPPEINTVQVTSTAV;  
(SEQ. ID. NO. 12)

TEIPTINTIAΣGEPTSTPTTEAVESTVATLEDΣPEVIESPPEINTVQVTSTAV;

10 (SEQ. ID. NO. 16)

TEIPTINTIASGEPTSTPTTEAVESTVATLEDSPEVIESPPEINTVQVTSTAV;  
(SEQ. ID. NO. 17)

and conservative substitutions therein.

5. An microbial peptide as claimed in any one of claims 1 to 4 in which  
15 the peptide includes an amino acid sequence selected from the group  
consisting of:-

MAIPPKKNQDKTEIPTINTIASGEPTSTPTIEAVESTVATLEAΣPEVIESPPEINT  
VQVTSTAV; (SEQ. ID. NO. 6)

MAIPPKKNQDKTEIPTINTIAΣGEPTSTPTIEAVESTVATLEAΣPEVIESPPEINT

VQVTSTAV; (SEQ. ID. NO. 15)

TEIPTINTIASGEPTSTPTIEAVESTVATLEASPEVIESPPEINTVQVTSTAV; and  
(SEQ. ID. NO. 16)

TEIPTINTIASGEPTSTPTTEAVESTVATLEDSPEVIESPPEINTVQVTSTAV;  
35 (SEQ. ID. NO. 17)

7. A chimeric compound, the compound including the peptide as claimed in any one of claims 1 to 6 conjugated to a non-peptide molecule.
8. A chimeric compound as claimed in claim 7 in which the non-peptide portion of the molecule includes acyl groups.
- 5 9. An antimicrobial composition, the composition including the peptide as claimed in any one of claims 1 to 6 and an acceptable carrier.
10. A method of treating or preventing dental caries or periodontal disease in a subject, the method comprising the step of administering a peptide as claimed in any one of claims 1 to 6 or the composition as claimed
- 10 in claim 9 to the teeth or gums of the subject in need of such treatments.

### Information on patent family members

International application No.  
**PCT/AU 98/00972**

This Annex lists the known "A" publication level patent family members relating to the patent documents cited in the above-mentioned international search report. The Australian Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
